1. INTRODUCTION

The project “Streamlining IT Procurement: Automating Standard Laptop Tasks” is designed to automate the process of handling standard laptop requests using the ServiceNow platform and Flow Designer.The system design connects the Service Catalog, approval process, Flow Designer, Requested Item, and Catalog Task. When a Standard Laptop request is submitted and approved, the configured Flow creates a Catalog Task and assigns it to the Hardware group for laptop configuration. The design aims to reduce manual intervention, improve task assignment, and support faster processing of standard laptop requests.

2. SYSTEM WORKFLOW

The system workflow represents the complete sequence followed by a Standard Laptop request.

Workflow Steps

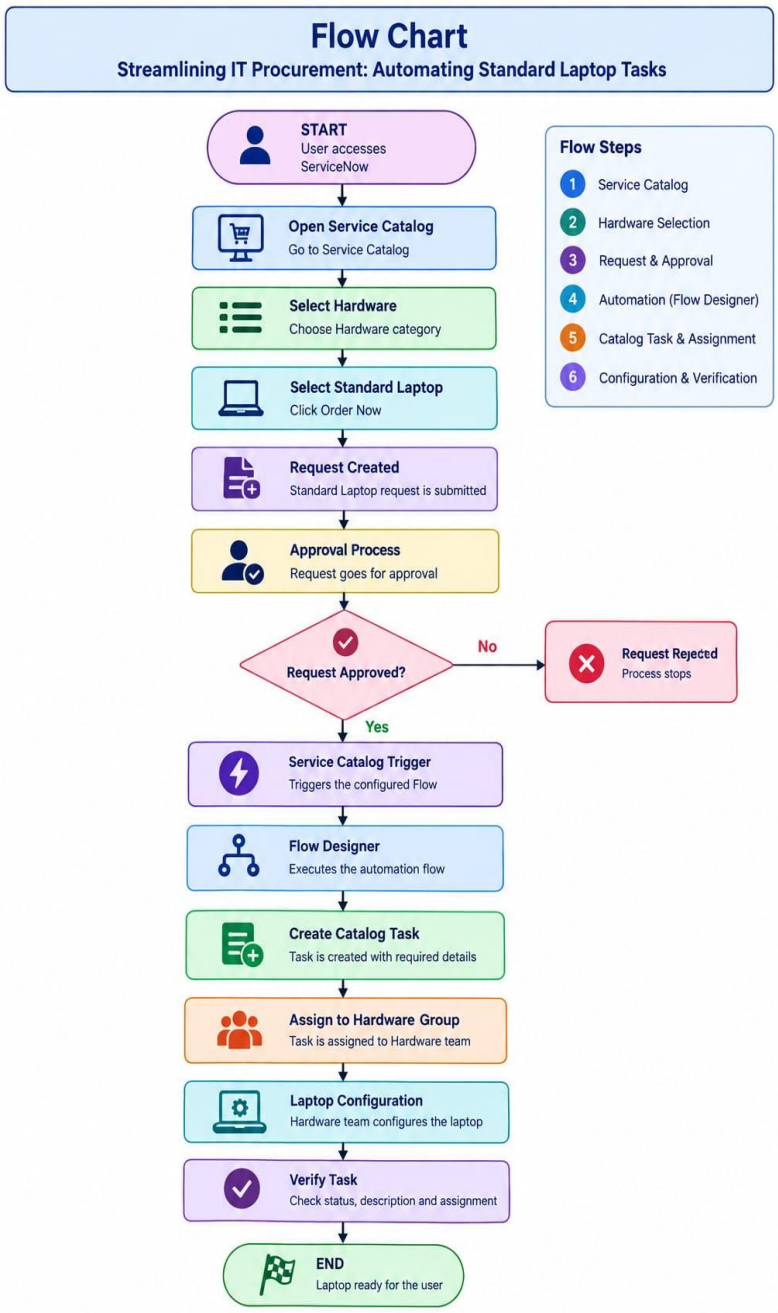

1. User opens the Service Catalog.
2. User selects Hardware.
3. User selects Standard Laptop.
4. User clicks Order Now.
5. The laptop request is created.
6. The request goes through the approval process.
7. The approver approves the request.
8. The Service Catalog trigger starts the configured Flow.
9. Flow Designer processes the approved request.
10. A Catalog Task is automatically created.

11. The task is assigned to the Hardware group.
12. The Hardware team performs the required laptop configuration.
13. The generated Catalog Task is verified.

3. FLOW CHART

The flow chart provides a visual representation of the automated process.

Flow Chart

The Flow Designer configuration contains a Service Catalog trigger and a Create Catalog Task action.

4. SYSTEM ARCHITECTURE

The system architecture describes how the major components of the project are connected.

Architecture Components

1. User Layer: The user accesses the ServiceNow Service Catalog and selects the Standard Laptop item.

2. Service Catalog Layer: : The Standard Laptop catalog item receives the user's request and creates the required request record.

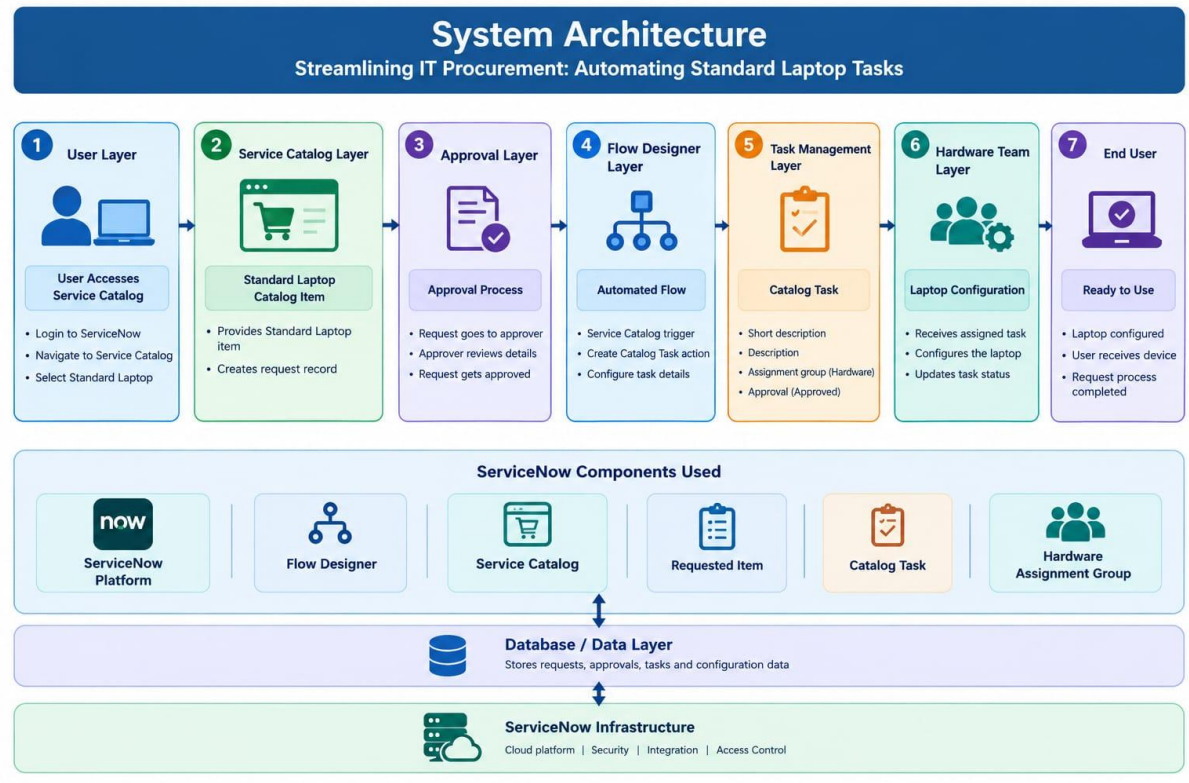

3. Approval Layer: : The request is processed through the approval stage. The request must be approved before the configured automation proceeds.

4. Flow Designer Layer: : Flow Designer handles the automation. The Service Catalog trigger starts the Flow and the configured action creates the Catalog Task.

5. Task Management Layer: The generated Catalog Task contains the required task information and is assigned to the Hardware group.

6. Hardware Team Layer: The Hardware team receives the assigned task and performs the required laptop configuration.

Architecture Flow

The architecture is designed around the ServiceNow components used in the project.

PAGE DESIGN

The project page design provides a simple structure for accessing and managing the required functions.

- Page 1 – ServiceNow Home
- The user accesses the ServiceNow platform and opens the required application modules.
- Page 2 – Flow Designer
- The administrator opens Flow Designer to create and configure the automation Flow.
- Page 3 – Flow Configuration
- The Flow name, application, run user, trigger, and actions are configured.
- Page 4 – Catalog Task Configuration
- The required task details such as description, assignment group, and approval are configured.
- Page 5 – Standard Laptop Catalog
- The user accesses the Hardware category and selects the Standard Laptop item.
- Page 6 – Order Status
- The submitted request can be checked through the order status and request number.
- Page 7 – Approval Page
- The request is opened and the approval is completed through the Approvers section.
- Page 8 – Requested Item
- After approval, the Requested Item record is opened to continue tracking the request.
- Page 9 – Catalog Task
- The generated Catalog Task is opened and its status, description, and assignment group are verified.
- Page 10 – Final Task Verification

The final screen confirms that the Catalog Task has been created with the required details and assigned to the Hardware group.

5. CONCLUSION

The Project Design defines the workflow, flow chart, system architecture, screen design, and page structure required for implementing the automated Standard Laptop procurement process. By connecting Service Catalog with Flow Designer and Catalog Tasks, the system is designed to automatically generate and assign the required hardware configuration task after approval. This design provides a clear structure for the development and testing stages of the project.
