PROJECT PLANNING PHASE

The project planning phase focuses on planning an automated IT procurement process for standard laptop orders using ServiceNow Flow Designer. The main aim is to reduce manual work, avoid delays in laptop configuration, improve task allocation, and provide a smooth experience for users requesting standard laptops.

PROJECT OBJECTIVE

The objective of the project is to implement an automated workflow for procurement and configuration of standard laptops. The workflow should create tasks automatically after approval and assign them to the Hardware team for configuration.

PROJECT PLANNING ACTIVITIES

- Identify the existing problem in the standard laptop procurement process.
- Define the requirements for automating standard laptop requests.
- Create a Flow in ServiceNow Flow Designer with the name “Standard Laptop Task”.
- Configure the Flow to run using the System User.
- Configure the Service Catalog trigger for the workflow.
- Configure the “Create Catalog Task” action.
- Use the Requested Item record while creating the Catalog Task.
- Set the short description and description as “Laptop need to Configured”.

- Assign the generated task to the “Hardware” assignment group.
- Set the approval condition as “Approved”.
- Save and activate the Flow.
- Assign the created Flow to the Standard Laptop Service Catalog item.
- Test the Standard Laptop request through the Service Catalog.
- Submit the request and complete the approval process.
- Verify that the Catalog Task is automatically created.
- Verify the task status, short description, and assigned Hardware group.

PROJECT MILESTONES

Milestone 1 – Flow:

Create and configure the Flow Designer flow to automatically create a Catalog Task after the Service Request is approved and assign it to the Hardware group.

Milestone 2 – Flow Assignment:

Assign the created “Standard Laptop Task” flow to the Standard Laptop Service Catalog item.

Milestone 3 – Service Catalog:

Place a Standard Laptop order through the Service Catalog, complete the approval process, and verify that the Catalog Task is created with the correct information and Hardware assignment.

RESOURCE PLANNING

The main resource required for this project is the ServiceNow platform. ServiceNow provides the environment for creating the Service Catalog item and implementing the automated Flow.

The main ServiceNow components planned for use are:

Service Catalog

Flow Designer

Service Catalog Trigger

Create Catalog Task action

Requested Item

Catalog Task

Hardware Assignment Group

Approval process

TESTING AND VALIDATION PLANNING

After configuring the Flow, the project requires testing to ensure that the automation works correctly.

The testing process includes placing a Standard Laptop order through the Service Catalog, checking the order status, opening the Request Number, checking the Approvers section, approving the request, and opening the Requested Item.

The Catalog Tasks section is then checked to confirm that the task has been created with the correct short description and assigned group.

EXPECTED RESULT

The planned system should automate the standard laptop procurement process. Once the Standard Laptop request is approved, a Catalog Task should be created automatically and assigned to the Hardware team. This reduces manual intervention, improves resource utilization, reduces user waiting time, and increases the efficiency of IT procurement operations. The automation is expected to reduce manual overhead, minimize user waiting time, improve task allocation, optimize IT resources, and enhance overall productivity in IT procurement operations

PROJECT SUCCESS CRITERIA

The project will be considered successfully implemented when:

- The Standard Laptop item is available in the Service Catalog.
- A user can successfully place a Standard Laptop request.
- The request can proceed through the approval process.
- The Flow is triggered after the required approval.
- A Catalog Task is automatically created.
- The task contains the required description.
- The task is assigned to the Hardware group.
- The generated task can be viewed from the Requested Item.
- The task status and assignment details are displayed correctly.
