INTRODUCTION

IT procurement is an important process for organizations to provide laptops and other IT equipment to employees. Traditional laptop procurement can involve manual requests, approvals, communication, and task assignments, which may lead to delays and errors. The project "Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer" aims to automate the standard laptop ordering process using ServiceNow Flow Designer. The system allows employees to submit laptop requests, automatically routes them for approval, creates procurement tasks, and sends notifications to the appropriate teams. This helps make the procurement process more organized, transparent, and efficient.

REQUIREMENT ANALYSIS

The project "Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer" focuses on improving the existing IT procurement process by reducing manual work and delays. The current process requires manual handling of standard laptop orders, which may cause configuration delays and oversight. The proposed system uses ServiceNow Flow Designer to automate the procurement and configuration process. The system allows users to request a Standard Laptop through the Service Catalog. After the request is approved, a Catalog Task is automatically created and assigned to the Hardware team for configuration. This helps reduce user waiting time, minimize manual intervention, improve resource utilization, and increase the efficiency of IT procurement operations.

FUNCTIONAL REQUIREMENTS

❖ The system should allow users to request a Standard Laptop through the Service Catalog.

❖ The system should create a service request when the user places a Standard Laptop order.

❖ The request should go through the required approval process.

❖ After the request is approved, the Flow Designer should automatically create a Catalog Task.

❖ The Requested Item record should be used while creating the Catalog Task.

❖ The Catalog Task should contain the short description “Laptop need to Configured”.

❖ The description field should contain “Laptop need to Configured”.

❖ The Catalog Task should be automatically assigned to the Hardware assignment group.

❖ The approval field should be set to “Approved”.

❖ The Standard Laptop Service Catalog item should be connected with the created flow.

❖ The Hardware team should be able to view the generated Catalog Task.

❖ The task should display the updated status, short description, and assigned group.

❖ The system should automatically perform these activities after approval without requiring manual task creation.

NON-FUNCTIONAL REQUIREMENTS

- **Performance:** The system should create the Catalog Task promptly after the Standard Laptop request is approved.
- **Reliability:** The flow should consistently create the required Catalog Task and assign it to the Hardware group.
- **Usability:** The Service Catalog should provide a simple process for users to place a Standard Laptop request.
- **Security:** The system should allow authorized users to access, approve, and process the laptop request.
- **Maintainability:** The flow should be easy to manage and maintain in ServiceNow Flow Designer.
- **Efficiency:** The system should reduce manual intervention and improve the utilization of IT resources.
- **Accuracy:** The system should automatically populate the required task information and assignment group.
- **Availability:** The ServiceNow system should be available for users to submit requests and for the Hardware team to process tasks.
- **Scalability:** The automated process should support multiple Standard Laptop requests efficiently.
- **User Experience:** The system should provide a smooth and efficient experience for users requesting standard laptops.

SOFTWARE TOOLS REQUIREMENTS

- ServiceNow
- ServiceNow is the main platform used for implementing the IT procurement process.
- Flow Designer
- Flow Designer is used to automate the Standard Laptop procurement workflow and create the Catalog Task after approval.
- Service Catalog
- The Service Catalog is used by users to select and order the Standard Laptop.
- Process Automation
- ServiceNow Process Automation is used to create and manage the automated workflow.
- Web Browser
- A web browser such as Google Chrome, Microsoft Edge, or Mozilla Firefox is required to access ServiceNow.
- Operating System
- A supported operating system such as Windows, Linux, or macOS is required.
- Internet Connection
- A stable internet connection is required to access the ServiceNow platform.

HARDWARE REQUIREMENTS

- **Computer or Laptop**

  A computer or laptop is required to access and configure the ServiceNow application.

- **Processor**

  A dual-core processor or higher is recommended.

- **RAM**

A minimum of 4 GB RAM is recommended for accessing the ServiceNow web interface.

- **Storage**

  Adequate storage is required for the operating system, browser, and other required software.

- **Display**

  A standard computer display is required to view and operate the ServiceNow interface.

- **Keyboard and Mouse**

  A keyboard and mouse or touchpad are required for navigation and configuration.

- **Network**

  A stable Wi-Fi or broadband internet connection is required for accessing the ServiceNow instance.

CONCLUSION

The requirement analysis for the project "Streamlining IT Procurement: Automating Standard Laptop Tasks" identifies the need for an efficient and automated process for handling standard laptop requests. The analysis shows that manual task creation and assignment can cause delays, increase workload, and affect the timely configuration of laptops.

Based on the identified requirements, the project plans to use ServiceNow Flow Designer to automate the workflow. The system is designed to process the Standard Laptop request after approval, automatically create a Catalog Task, and assign it to the Hardware group with the required task details. Thus, the requirement analysis provides a clear foundation for designing and developing the automated workflow. It ensures that the planned system addresses the identified procurement issues and supports faster processing, reduced manual intervention, and improved IT resource utilization.
